

Suraksha Chemicals Pvt. Ltd.

Unit 4 – Specialty Chemicals & Intermediates, Ambarnath, Maharashtra

STANDARD OPERATING PROCEDURE

Confined Space Entry – Document SOP-CSE-01

Document No.	SOP-CSE-01
Issued By	Meera Iyer, Safety Officer (EHS)
Effective Date	01-Jan-2024
Applies To	Reactor R-220, storage vessels, and other enclosed process equipment

1. Purpose

This procedure defines the steps required before any person enters a confined space at Unit 4, including Reactor R-220 and other storage vessels, to ensure entrants are protected from atmospheric, mechanical, and access-related hazards.

2. Pre-Entry Requirements

- Atmospheric testing (oxygen, flammable gas, toxic gas) must be conducted and recorded immediately before entry;
- Testing must be repeated at intervals not exceeding 60 minutes during occupancy;
- A trained standby attendant must be positioned at the entry point for the full duration of entry, with no other duties assigned during that time;
- Continuous communication (visual, verbal, or radio) must be maintained between the entrant and the standby attendant at all times;
- Rescue equipment appropriate to the specific confined space must be staged at the entry point before entry commences.

3. Entry Procedure

The entrant confirms atmospheric test results with the standby attendant before entering. Entry is only permitted once oxygen levels, flammable gas concentration, and toxic gas concentration are all within acceptable limits. The entrant wears a full-body harness connected to a retrieval line where the confined space geometry allows, and communicates status to the standby attendant at regular intervals throughout the task.

4. During Entry

If atmospheric conditions deteriorate at any point, or communication with the entrant is lost, the standby attendant immediately initiates the emergency withdrawal procedure and notifies the Safety Officer. Re-entry is not permitted until the cause of the deterioration has been identified and corrected.

5. Post-Entry

On completion of the task, the entrant exits the confined space, and the standby attendant confirms the space is secured against unauthorised entry. Atmospheric testing equipment is returned to storage and

recalibrated per the manufacturer's schedule before next use.

6. Training

All entrants and standby attendants must hold a current Confined Space Entry training record before participating in this procedure, refreshed annually.
